

Sea Level Rise and the Conservation of Wetlands

RI Land and Water Summit March 8, 2014

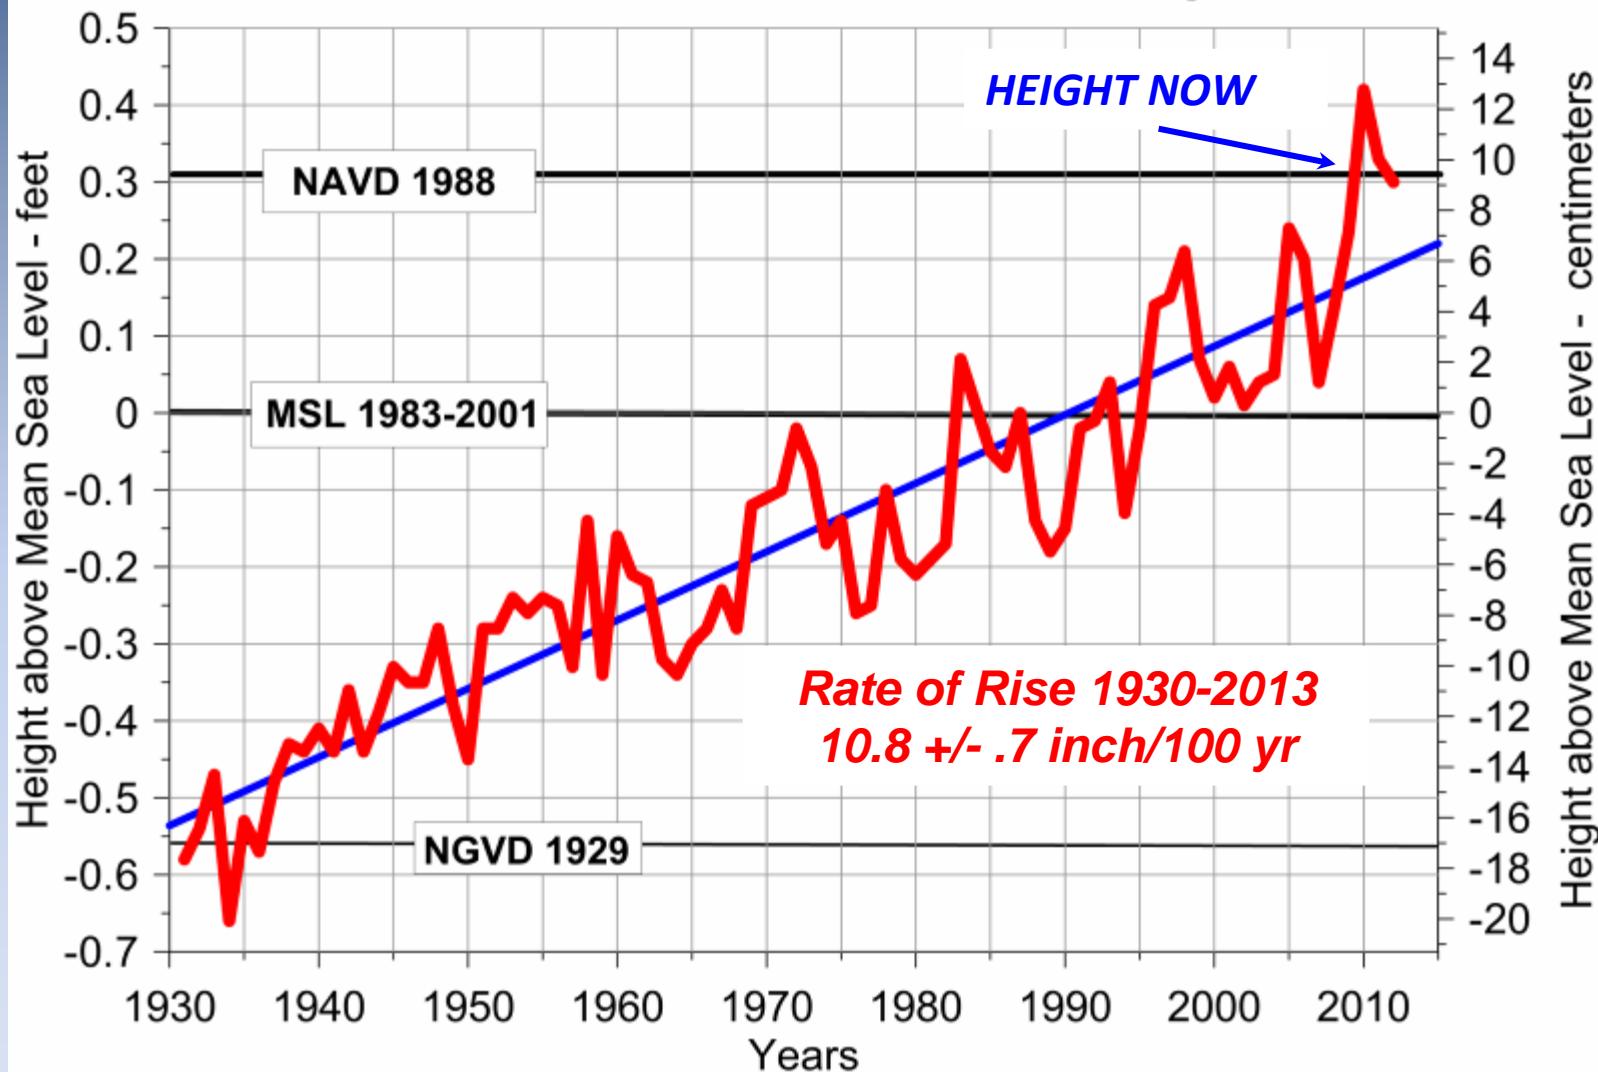

R. Hancock

Rhode Island has lost 53% of its salt marshes over the last 200 years* due to man-made alterations (ditching and filling), resulting in a loss of approximately 4000 acres statewide

Opportunities for Upland Migration and Restoration

With the proper conditions,
salt marsh can migrate upland

We can model *likely* future
habitat

Marsh Migration

Source: Save The Bay

Impediments to Coastal Marsh Migration

STB's 10 years of restoration monitoring has shown that conditions can change rapidly in tidally restricted marshes

Recently, similar degraded conditions have been observed in marshes with no tidal restrictions

Sea Level Affecting Marshes Model (SLAMM)

Simulates the dominant processes involved in wetland conversions during long term sea level rise

Applied and improved since 1985

Used throughout the world

<http://www.warrenpinnacle.com/prof/SLAMM/>

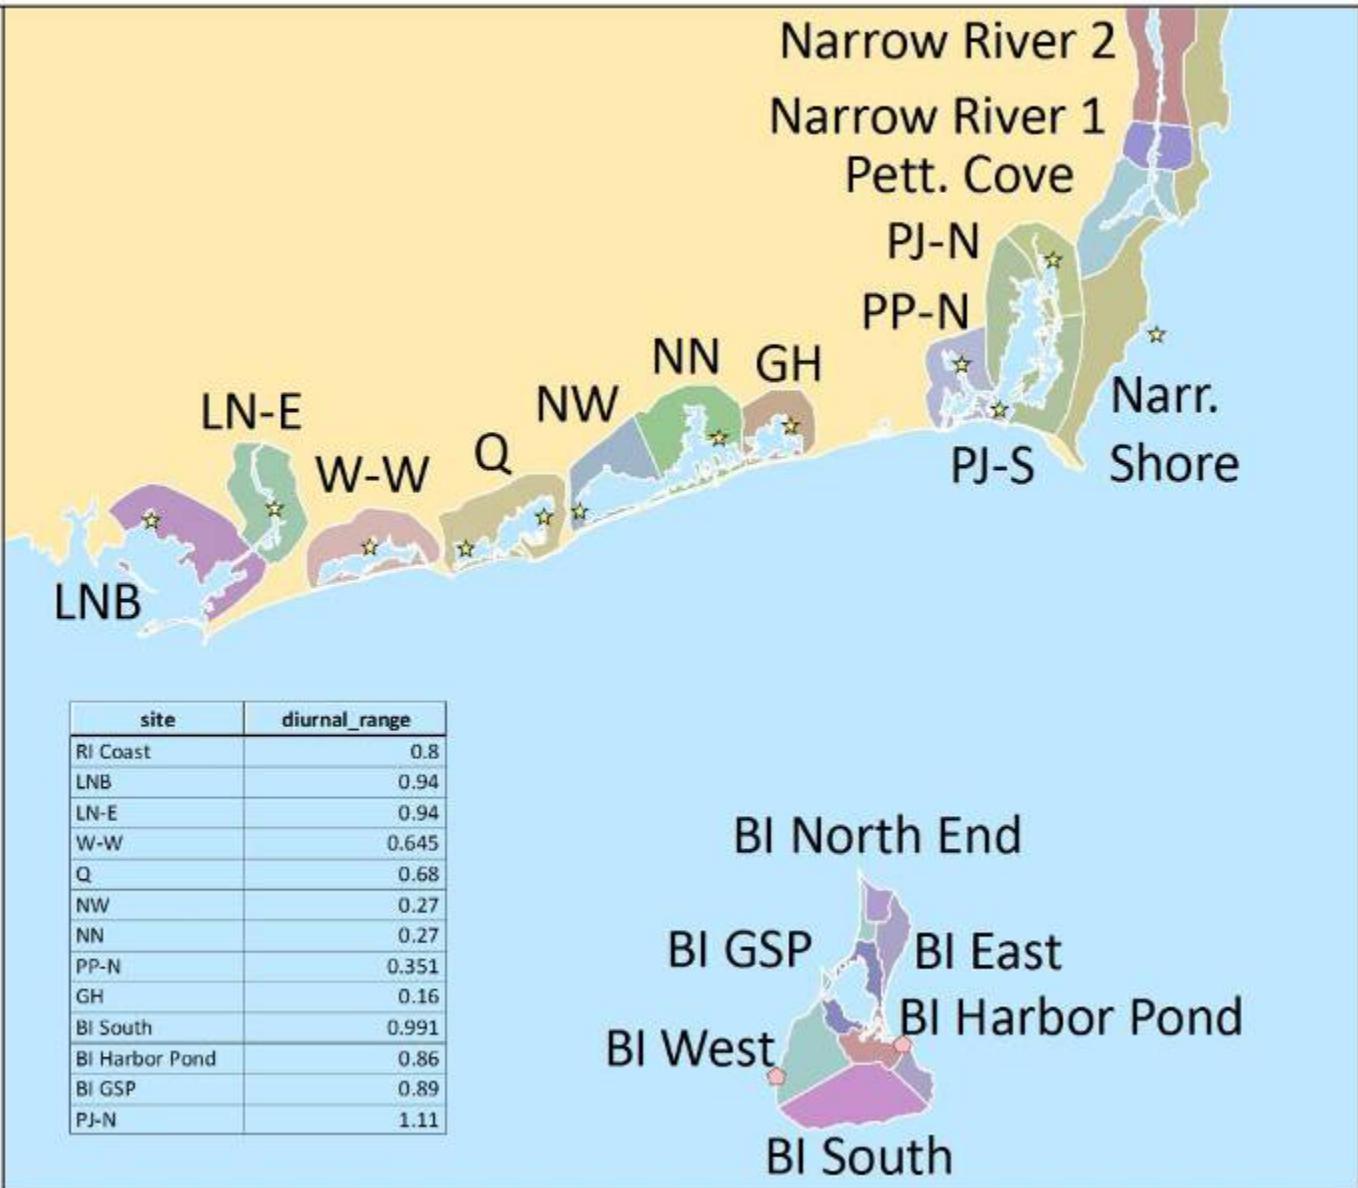

Model Inputs - Each area is unique

SLAMM Subsites

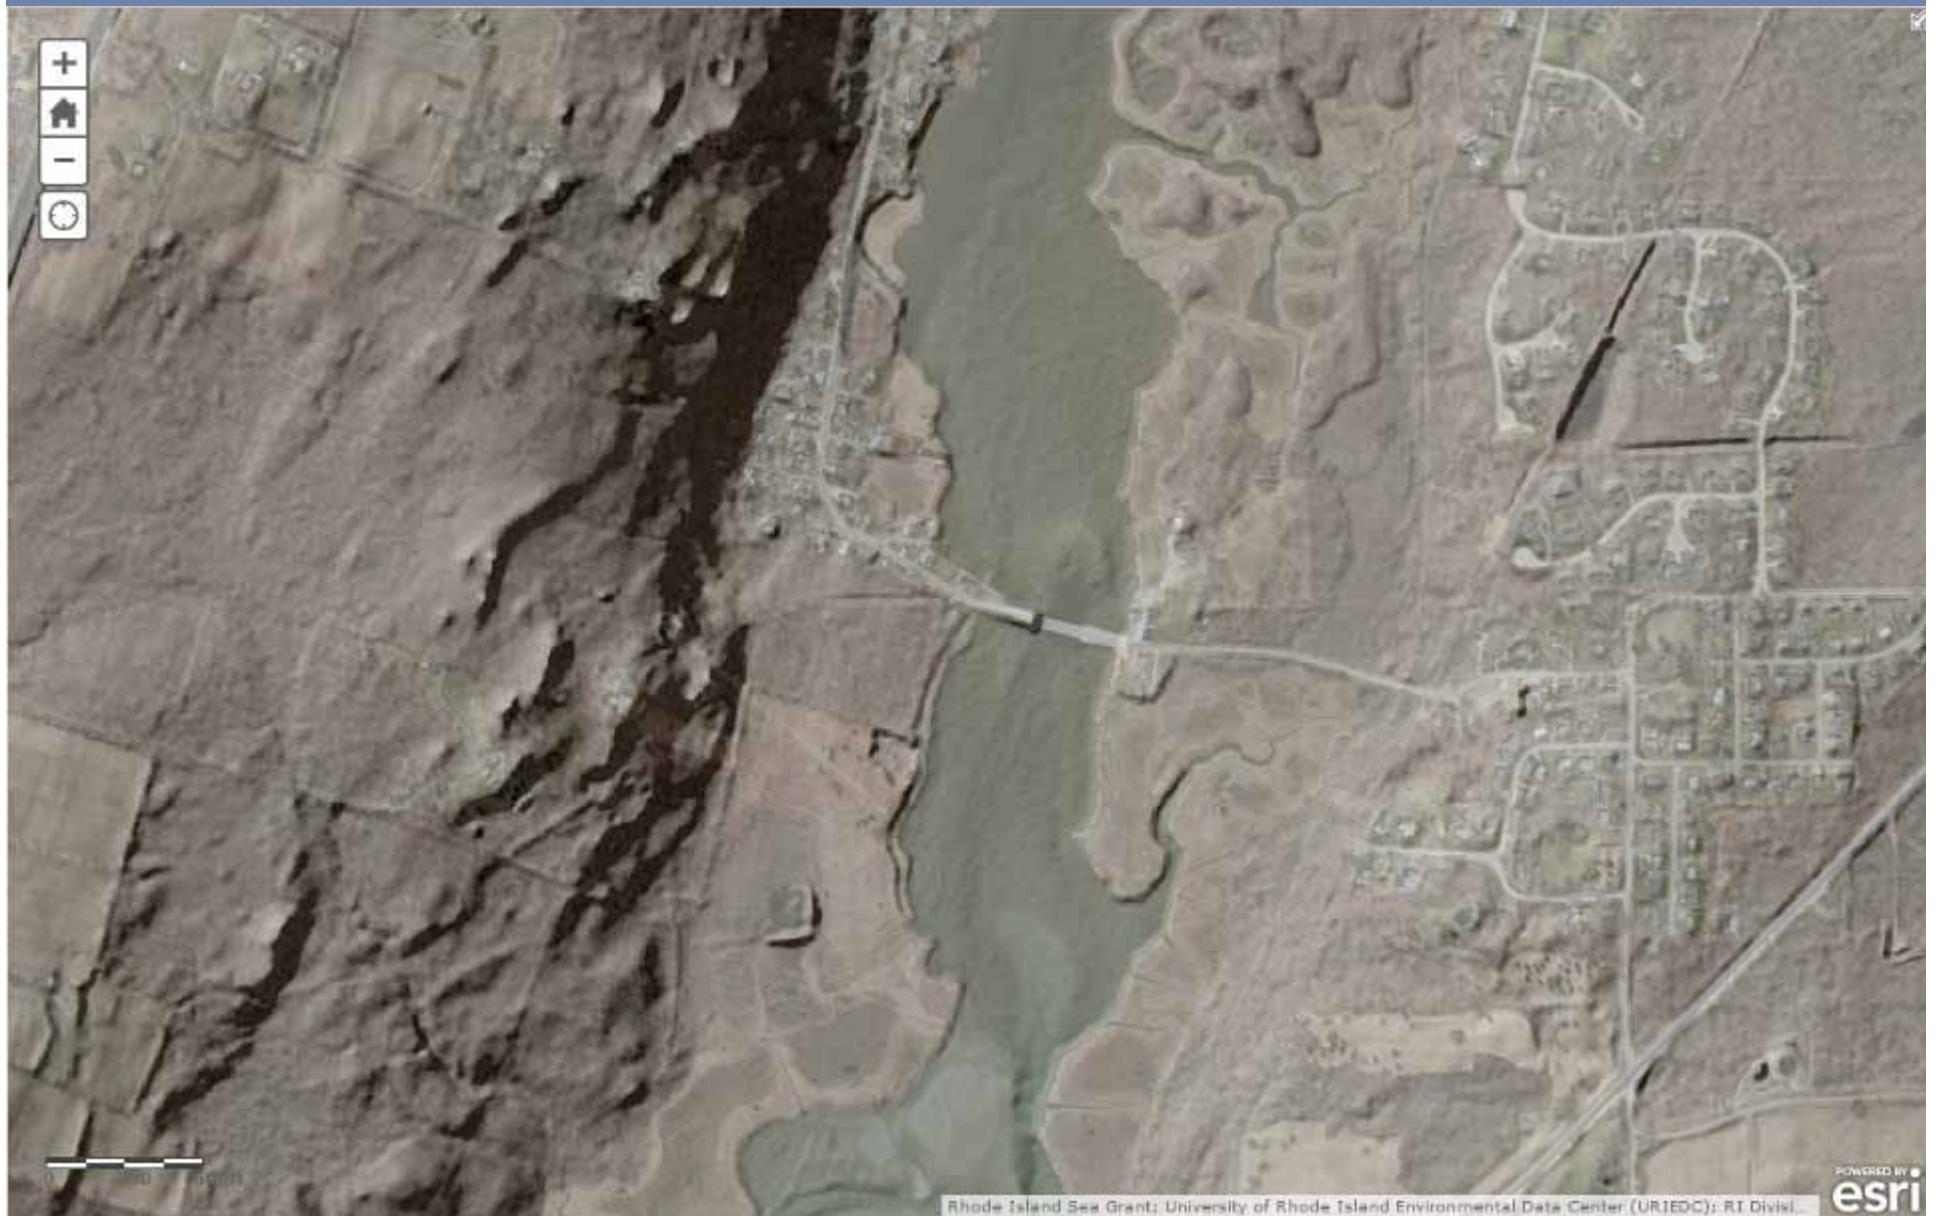

- ★ ACOE Tidal Data Stations
- NOAA Tidal Stations

SLAMM Variables:
direction offshore
MTL-NAVD88
accretion rates
erosion rates
salt elevation
sedimentation rate
storm frequency

| site | diurnal_range |
|----------------|---------------|

- Scrub/Shrub Transitional Marsh
- Tidal Flat
- Swamp
- Fresh Marsh
- Open Water
- Beach
- Rocky Intertidal

SLAMM Project Goals

1. Develop marsh migration modeling results
2. Identify existing vulnerable wetlands
3. Identify impacted upland parcels – opportunities and challenges
4. Develop new CRMC coastal program adaptive strategies, policies and standards
5. Increase local capacity to proactively incorporate sea level rise for wetlands (e.g., comprehensive plans, zoning codes, conservation, etc.)

Conservation Opportunities

1. Use model output to help prioritize coastal parcels for future conservation
2. Inform management of currently conserved parcels adjacent to coastal wetlands
3. Identify opportunities for removal of barriers to wetland inland migration

Sea Level Rise and the Conservation of Coastal Wetlands

Challenges facing coastal wetlands

Rhode Island's coastal wetlands provide critical nursery habitat for fisheries, play a key role in absorbing nutrients that would otherwise pollute waters, and provide important economic benefits for fisheries and tourism. In addition, wetlands support recreational activities and help protect local areas from coastal flooding. These wetlands, especially tidal marshes, are very susceptible to impacts from climate change and accelerated sea level rise. As sea levels rise, marshes move, or migrate, farther upland under favorable conditions where they can still maintain
